

Productivity Toolkit for SolidWorks

Boost productivity with automated naming and publishing

Productivity Toolkit allows for automatic naming of SolidWorks documents in a structured way. Connect serial number to SolidWorks property tab builder to update custom properties. Productivity Toolkit also rebuilds and updates external documents in real time, to ensure all published documents are always up-to-date.

Productivity Toolkit Includes:

● Automated Serial number generator

- Write serial number to custom properties
- Flexible serial number combinations
- Naming of native SolidWorks documents

● Automated Transfer properties

- Move/Update properties from Part/Assembly to Drawings

● Integration to SolidWorks property tab builder

- Use SolidWorks property tab settings to connect parameters

● Automated publishing of external documents

- Automates the task of keeping corresponding documents consistent with their 3D or 2D master document
- Output formats: PDF, DWG, DXF, edrawing, 3dxml, Tiff and more

Productivity Toolkit allows multiple document generation jobs to be defined and named from within the Productivity Toolkit interface. Each job defines settings like document type, filename and location. Rules related to specific drawing sheets can also be defined.

Additionally, design data from within custom properties can be used to predefine the filename syntax. Component numbers and revision tags can be applied as filenames for the external document.
